HENRY HOLT AND COMPANY
1903

CONTENTS

INTRODUCTION BY DR. HENRY FRANKLIN GIDDINGS,	iii
PREFACE TO THE FIRST EDITION,	lx
PREFACE TO THE SECOND EDITION,	xiii

CHAPTER I.—UNIVERSAL REPETITION

I.—The overlooked regularity from a certain point of view of social facts. Their analogies with natural facts. The three forms of Universal Repetition: undulation, generation, imitation. Social science and social philosophy. Animal societies,	1
II.—Three analogous laws in physics, in biology, in sociology. Why everything is number and measure,	14
III. and IV.—Analogies between the three forms of Repetition. They imply a common tendency towards a geometrical progression. Linguistic, mythological, etc., refractions. Happy or unhappy interferences of imitation. Conflict-interferences and combination-interferences (inventions). Outline of social logic,	16
V.—Differences between the three forms of Repetition. Generation is unconditioned undulation. Imitation is generation at a distance. The abbreviation of embryonic phases,	33

CHAPTER II.—SOCIAL RESEMBLANCES AND IMITATION

I.—Social resemblances which are not caused by imitation and vital resemblances which are not caused by generation. A distinction between <i>analogies</i> and <i>homologies</i> in comparative sociology like that in comparative anatomy. A genealogical tree of inventions derived from master-inventions. The slow and inevitable propagation of examples even among sedentary and shut-in populations,	37
II.—Is there a law of civilisations which imposes upon them a common direction or, at least, a common goal, and, consequently, a law of increasing resemblances, even without imitation? Proofs of the contrary,	51

CHAPTER III.—WHAT IS A SOCIETY?

I.—Inadequacy of the economic or even of the juristic conception: Animal societies. Nation and society not to be confused. Definition,	59
--	----

II.—Definition of the social type,	68
III.—Perfect <i>sociality</i> . Biological analogies. The hidden and perhaps original agents of universal repetition,	69
IV.—An idea of Taine's. The contagion of example and suggestion. Analogies between the social and the hypnotic state. Great men. Intimidation is a nascent social state,	74

CHAPTER IV.—WHAT IS HISTORY? ARCHÆOLOGY AND STATISTICS

I. and II.—Distinction between the anthropologists and the archæologists. The archæologist unconsciously holds my point of view. Barrenness of invention characteristic of primitive times. Imitation has been objective and widespread from the most remote periods. What archæology teaches us,	89
III.—The statistician sees things, at bottom, like the archæologist. He pays exclusive attention to imitative editions of every ancient and modern invention. Analogies and differences,	102
IV. and V.—What Statistics ought to be; its <i>desiderata</i> . The interpretation of its curves, namely its <i>rises</i> , <i>horizontal</i> s, and <i>falls</i> , is given by my point of view. The tendency of all ideas and wants to spread in a geometrical progression. The encounter, coalescence, and rivalry of these tendencies. Examples. The desire for paternity and its variations. The desire for liberty and other desires. A general empirical law; three phases; importance of the second,	109
VI. and VII.—The curves of Statistics and the flight of a bird. The eye and ear considered as numerical registers of ethereal and sonorous vibrations, representative statistics of the universe. The probable future <i>rôle</i> of Statistics. Definition of History,	132

CHAPTER V.—THE LOGICAL LAWS OF IMITATION

The reason why, given a number of inventions, some are imitated and some are not. Reasons of a natural order and of a social order, and, among the latter, logical reasons and extra-logical influences. A linguistic example,	140
I.—That which is imitated is belief or desire, a fundamental antithesis. The Spencerian formula. Social progress and individual thought. The need of invention and the need of criticism have the same source. Progress through the <i>substitution</i> and progress through the <i>accumulation</i> of inventions,	144
II.— <i>The logical duel</i> . Everything in history is a <i>duel</i> or a <i>union</i> of inventions. The one always says <i>yes</i> and the other, <i>no</i> . Linguistic, legislative, judicial, political, industrial, artistic duels.	

Developments. Every duel is twofold, every adversary affirming his own thesis at the same time that he denies that of his opponent. The moment when the rôles are reversed. The individual duel and the social duel. The *dénouement*: Three possible outcomes, . . . 154

III.—*The logical union*. The period of accumulation which precedes the period of substitution must not be confused with that which follows it. Distinction between the linguistic, religious, political, etc., *grammar* and *dictionary*. The dictionary enlarges more readily than the grammar improves, 173

Other considerations, 184

CHAPTER VI.—EXTRA-LOGICAL INFLUENCES

Different characteristics of imitation: 1. Its increasing precision and exactness; ceremonial and procedure. 2. Its conscious or unconscious character. The advance of imitation:

I.—From the inner to the outer man. Different physiological functions compared from the point of view of their transmissibility by example. Primitive obedience and credulity. Dogmas are transmitted before rites. Admiration precedes envy. Ideas are communicated before expressions; ends, before means. The explanation of *survivals* by this law. Its universality. Its application even to feminine imitation, 194

II.—From the superior to the inferior. Exceptions to this law; its truth comparable with that which governs the radiation of heat. 1. Examples. The *martinella* and *carroccio*. The Phœnicians and the Venetians. The utility of aristocracies. 2. Ecclesiastical hierarchy and its effects. 3. The most superior, among the least distant, is the one imitated. *Distance* in the social sense. 4. In democratic periods nobilities are replaced by great cities which resemble them for good and evil. 5. In what *social superiority* consists; in subjective or objective characteristics which favor the exploitation of inventions at a given time. 6. Application to the problem of the origins of the feudal system, . . . 213

CHAPTER VII.—EXTRA-LOGICAL INFLUENCES
(CONTINUED)—CUSTOM AND FASHION

Ages of *custom* when the ancient model, paternal or patriotic, is supreme; ages of *fashion* when the advantage is often with the new, exotic model. Through *fashion*, imitation is set free from generation. The relations of imitation and generation are like those of generation and undulation. Transition from custom to fashion followed by a return to a broader custom. The application of this law:

I.—To languages. The rhythm of the diffusion of idioms. The

formation of the Romance languages. Characteristics and results of the aforesaid transformations,	255
II.—To religions. All religions proceed from exclusivism to proselytism; they then withdraw into themselves. Reproduction of these three phases from the most remote periods. Cult of the foreigner, not alone of the ancestor, from this time on. Worship of the foreign beast. Why very ancient gods are <i>zoömorpic</i> . Divine fauna. Worship is a kind of superior domestication. Spiritualisation of religions which spread through fashion. Moral effects. The social importance of religions,	265
III.—To governments. The twofold origin of states, the family and the horde. In every state, from remote antiquity, there have been two parties, the party of custom and the party of fashion. Frequency of the phenomenon of royal families of foreign blood. The fief an invention propagated by fascination; the same true of the feudal monarchy; and of the modern monarchy. Liberalism and cosmopolitanism. The final nationalisation of foreign importations. The way in which the United States were formed. Augustus, Louis XIV., Pericles. Criticism of Spencer's antithesis between militarism and industrialism compared with that of Tocqueville's between aristocracy and democracy,	287
IV.—To legislations. Juridical evolution. Custom-law and statute-law. Law is very multiform and very stable in times of custom, very uniform and very changeable in times of fashion. The spread of charters from town to town. Sumner Maine's <i>Ancient Law</i> . The rhythm of the three phases applied to criminal procedure. Successive characteristics of legislation. Classification,	310
V.—To usages and wants (political economy). Multiformity and stability of usages. Subsequent uniformity and rapid change. Production and consumption, a distinction universally applicable. The transmissibility of wants of consumption is always more rapid than that of the wants of production. Consequences of this unequal rate. The <i>ulterior</i> outlet in times of custom, the exterior outlet in times of fashion. Industry in the Middle Ages. Order of the successive forms of extensive industry. The price of fashion and the price of custom. Successive characteristics borrowed from the economic world and from social aspects compared, in changes of imitation. The reason of these changes, . . .	322
VI.—To morals and arts. Duties are in the beginning original inventions. Gradual enlargement of the moral public and of the art public. The art of custom is born from handicraft; it is professional and national. The art of fashion is non-utilitarian and exotic. Fashion-morality and custom-morality. Future probabilities. The historic phenonemon of <i>renascences</i> , both moral and æsthetic,	344

Contents

xxix

CHAPTER VIII.—REMARKS AND COROLLARIES

Summing up and conclusion. All the laws of imitation viewed from the same standpoint. Corollaries,	366
I.—The transition from the <i>unilateral</i> to the <i>reciprocal</i> . Examples: from decree to contract; from dogma to free-thought; from man-hunting to war; from court manners to urbanity. The necessity of these transformations,	371
II.—Distinction between the <i>reversible</i> and the <i>irreversible</i> in history. The irreversible in consequence of the laws of imitation, and the irreversible in consequence of the <i>laws of invention</i> . A word in regard to the latter subject. Changes of custom are in a certain measure irreversible as well. Great empires of the future. Final individualism,	379
